Array and ArrayLists

Comp 401 Recitation 2

Just a Quick Refresher on the Array

```
Remember arrays?

Type[] array=new Type[size];
```

```
int[] array=new int[3];
String[] array=new String[]{"Hello","World"};
Object[] array={obj1,obj2,obj3};
```

int[] arr = new int[6];

int[0] = 5;

5

int[1] = 4;

5 | 4

int[2] = 3;

System.out.println(arr[0]);

 \rightarrow 5

System.out.println(arr[3]);

→ ERROR??? Maybe nullpointerexception?

System.out.println(arr[6]);

→ ERROR!!! OutOfBoundsException

Some cool array functions

- Length of array
 array.length; WARNING: Length Does Not Indicate The Number of Entries
- Clone the array, returns a copy of the array
 with the same type
 array.clone();
- Get i-th index, i<array.length arrav[i]:

ArrayList<String> al = new ArrayList<String>();

→ QuickNote: If the data types in the lists are primitive (ie. int, boolean), then <e> part is not needed.

al.add("a");

a

al.add("b");

a b

al.add("c");

a b c

al.add("d");

a b c d

al.remove("b");

a c d

al.remove(1);

a d

System.out.println(al.get(1));

 \rightarrow d

a d

Some cool arraylist functions

- Length of arraylist arraylist.size();
- Set element at position index, return original value for element arraylist.set(int idx, E element);
- Get i-th index, i<arraylist.length arraylist.get(i);</p>

The 2 Dimensional Array

Did you know?

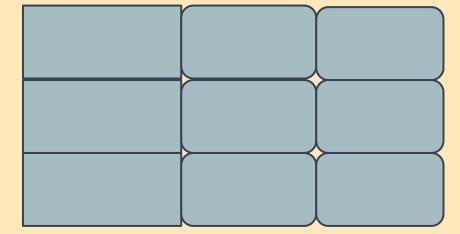

Each element of the array can also be another array!

Declaration: int[][] array=new int[size][size];

What is this Sorcery?

```
int[][] array=new int[3][3];
```

-Think of it as a 3x3 matrix

But that does not tell me anything...

```
int[][] array=new int[3][3];
It's a 2-in one deal.
```

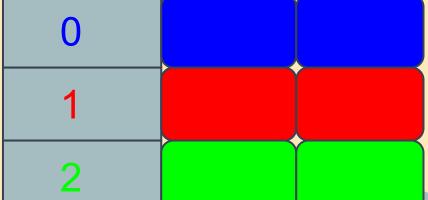

[0][0]	[0][1]	[0][2]
[1][0]	[1][1]	[1][2]
[2][0]	[2][1]	[2][2]

Think of it as a coordinate grid

The Best Approach: The Arrayception

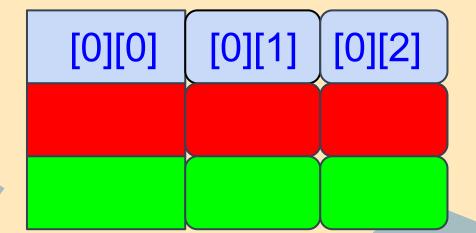

```
int[][] array=new int[3][3];
```

- -It is an array that has int[] as its type: hence int[][]
- -array[0-2][], the first indexes determines the index of array that contains all the other arrays.

A Means to an End

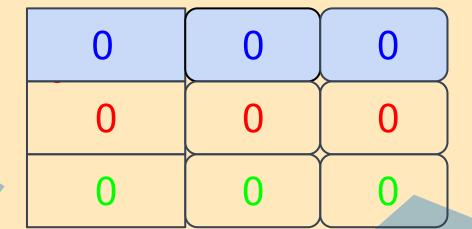

```
int[][] array=new int[3][3];
array[0][0-2], this dictates the index inside the array[0] in
the array of int[]
```

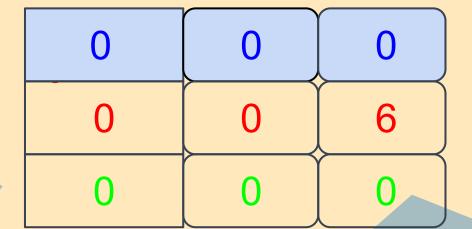

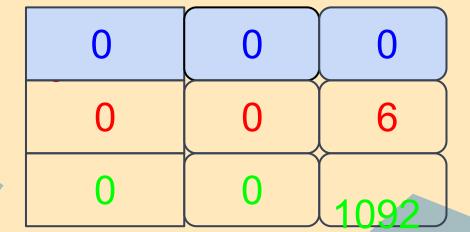

Seeing is Believing

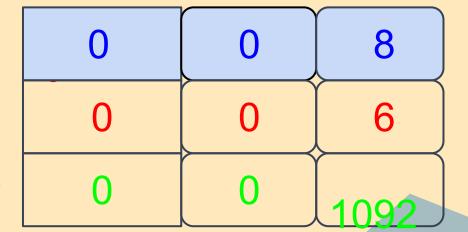

```
int[][] array=new int[3][3];
-array[0][0]=3
-array[1][1]=4
```

3	0	0
0	4	0
0	0	0

2-D Arrays? How about 10-D?

Object[][][][][][][][][] array=new Object[10][10][10][10] [10][10][10][10][10][10];

Total Number of entries=10^10=10 billion entries

Take Away from This: You can make multidimensional array of any size.

Winners of the Century: Array vs ArrayLists

Arrays

- →Doesn't need to be imported
- →Simpler coding
- →Uses less memory

ArrayLists

- → Dynamic Size, No limits! At least until your memory runs out
- → Search Function!
- →Easier to Manage ArrayList<ArrayList<Integer

>>

Losers of the Century: Array vs ArrayList

Arrays

- → Fixed size
- →No search feature
 so must iterate
 through entire array
 to find object

ArrayList

- →No Primitive Type
- int-Integer
- boolean-Boolean
- →Slow on occasions
- \rightarrow Imports
